## Outline

## Introduction

Modeling the interior structure of terrestrial planets

- The Earth's case
- Equations of state
- Radius versus mass

## Application to water-rich planets

- Equation of state of water

## Conclusions

- Plate tectonics on terrestrial planets
- What has been found so far?
- Outstanding questions

## Introduction

Objective 1: Describe how one can obtain the relationship between mass and radius and then use that relationship to determine the class of exoplanet being discovered. Mass and radius are two of the easiest parameters to obtain.

Objective 2: Address some outstanding issues such as the likelihood of plate tectonics on an exoplanet
Plate tectonics is important because volatiles (H2O, CO2) can be recycled into the planet.

## Numbers of Planet Candidates

- 68 Earth-size
- 288 super-Earth size

662

- 662 Neptune size
- 165 Jupiter size
- 19 super-Jupiter size

## Low mass exoplanets in March 2011

## Low mass exoplanets - July 2012

## Internal structure of the Earth - composition

|  | EEH Earth <br> model | PUM | LM | Core |
| :---: | :---: | :---: | :---: | :---: |
| O | 30,28 | 44,76 | 43,8 | 1,61 |
| Fe | 33,39 | 5,89 | 12,69 | 80,25 |
| Si | 19,23 | 21,35 | 24,28 | 10,34 |
| Mg | 12,21 | 23,21 | 16,18 | 0 |
|  |  |  |  |  |
| Total | $\mathbf{9 5 , 1 1}$ | $\mathbf{9 5 , 2 1}$ | $\mathbf{9 6 , 9 5}$ | $\mathbf{9 2 , 2}$ |
|  |  |  |  |  |
| Ni | 2,02 | 0,25 | 0,71 | 4,99 |
| Ca | 1,01 | 2,32 | 1,2 | 0 |
| Al | 0,93 | 2,13 | 1,1 | 0 |
| S | 0,85 | 0,01 | 0,01 | 2,57 |
|  |  |  |  |  |
| Total | $\mathbf{9 9 , 9 2}$ | $\mathbf{9 9 , 9 2}$ | $\mathbf{9 9 , 9 7}$ | $\mathbf{9 9 , 7 6}$ |

| O | 30,28 | 44,76 | 43,8 | 1,61 |
| :---: | :---: | :---: | :---: | :---: |
| Fe | 35,41 | 6,14 | 13,4 | 85,24 |
| Si | 19,69 | 22,41 | 24,83 | 10,34 |
| Mg | 13,68 | 26,59 | 17,93 | 0 |

Core : Iron + light element ( $\mathrm{S}, \mathrm{O}$, other).
Mantle : $\left(\mathrm{Mg}, \mathrm{Fe}_{2} \mathrm{Si}_{2} \mathrm{O}_{6}, \mathrm{Ca}\left(\mathrm{Mg}, \mathrm{Fe}^{2}\right) \mathrm{Si}_{2} \mathrm{O}_{6},(\mathrm{Mg}, \mathrm{Fe})_{2} \mathrm{SiO}_{4}\right.$ and Al phase $/(\mathrm{Mg}, \mathrm{Fe}) \mathrm{SiO}_{3},(\mathrm{Mg}, \mathrm{Fe}) \mathrm{O}$ and Al phase

## Input parameters

|  | EEH | PUM | LM | Core | /3LM $+1 / 3$ Core |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{Fe} / \mathrm{Si}$ | $\mathbf{0 , 9 0 9}$ | 0,138 | 0,273 | 4,166 | 0,944 |
| $\mathrm{Mg} / \mathrm{Si}$ | $\mathbf{0 , 8 0 3}$ | 1,372 | 0,835 | 0,000 | 0,691 |
| $\mathrm{Fe} /(\mathrm{Fe}+\mathrm{Mg})$ | 0,531 | 0,092 | 0,246 | 1,000 | 0,577 |

Five parameters are required:

| Solar values |  |  |
| :--- | ---: | ---: |
|  | $\mathrm{Mg}, \mathrm{Fe}, \mathrm{Si}$ | $+\mathrm{Ni}, \mathrm{Ca}, \mathrm{Al}, \mathrm{S}^{\prime}$ |
| $\mathrm{Fe} / \mathrm{Si}$ | 0,977 | $\mathbf{0 , 9 8 6}$ |
| $\mathrm{Mg} / \mathrm{Si}$ | 1,072 | $\mathbf{1 , 1 3 1}$ |
| $\mathrm{Fe} /(\mathrm{Fe}+\mathrm{Mg})$ | 0,477 | 0,466 |

1) Total mass of the planet
2) $\mathrm{Fe} / \mathrm{Si}$ (Stellar)
3) $\mathrm{Mg} / \mathrm{Si}$ (Stellar)
4) Water mass fraction (Earth like / Ocean planet)
5) $\mathrm{Mg} \#=\mathrm{Mg} /(\mathrm{Mg}+\mathrm{Fe})$

Large uncertainties on the composition of the Earth - how does it influence the $M(R)$ law

## Internal structure of the Earth

Mass $=610^{24} \mathrm{~kg}: 1 / 3$ core and $2 / 3$ mantle Upper and Lower mantle
Subsolidus Convection in the mantle Core : Iron + light element ( $\mathrm{S}, \mathrm{O}$, other).

Mantle : $(\mathrm{Mg}, \mathrm{Fe})_{2} \mathrm{Si}_{2} \mathrm{O}_{6}, \mathrm{Ca}\left(\mathrm{Mg}, \mathrm{Fe}^{2}\right) \mathrm{Si}_{2} \mathrm{O}_{6},\left(\mathrm{Mg}, \mathrm{Fe}_{2}\right)_{2 i O} \mathrm{SiO}_{4}$ and Al phase $/(\mathrm{Mg}, \mathrm{Fe}) \mathrm{SiO}_{3},(\mathrm{Mg}, \mathrm{Fe}) \mathrm{O}$ and Al phase

## Modeling the mass - radius relationship. Temperature

## Relationship between radius and mass

$$
\begin{gathered}
M=4 \pi \int_{0}^{R} r^{\prime} \rho\left(r^{\prime}\right) d r^{\prime} \\
\frac{d P}{d r}=-\rho(r) g(r) \\
g(r)=\frac{4 \pi G}{r^{2}} \int_{0}^{r} r^{2} \rho\left(r^{\prime}\right) d r^{\prime} \\
\left(\frac{\partial T}{\partial P}\right)_{S}=\frac{\alpha T}{\rho C p} \\
P_{t h}=\int_{T 0}^{T} \alpha K T d T
\end{gathered}
$$

Mass and radius are two of the few parameters. They are related to each other through a simple equation in a 1 D model.
Density depends on composition (elementary and molecular), pressure, and temperature In the calculations, the main parameters are:

- Amount of volatiles $\left(\mathrm{H}_{2} \mathrm{O}\right)$
- The amount of Fe
- Distribution of Fe between iron core and mantle

We need an Equation of State (EoS) which relates density to pressure and temperature. Example of the Birch-Murnagham EoS :

$$
P=\frac{3 K_{0 T}}{2}\left[\left(\frac{\rho}{\rho_{0}}\right)^{\frac{7}{3}}-\left(\frac{\rho}{\rho_{0}}\right)^{\frac{5}{3}}\right]\left\{1+\frac{3}{4}\left(K_{0 T-4}^{\prime}\right)\left[\left(\frac{\rho}{\rho_{0}}\right)^{\frac{2}{3}}-1\right]\right\}
$$

## The $3^{\text {rd }}$ order Birch-Murnagham EoS

$$
\left\{\begin{array}{l}
P(\rho, T)=\frac{3}{2} K_{T, 0}^{0}\left[\left(\frac{\rho}{\rho_{T, 0}}\right)^{7 / 3}-\left(\frac{\rho}{\rho_{T, 0}}\right)^{5 / 3}\right]\left\{1-\frac{3}{4}\left(4-K_{T, 0}^{\prime}\right)\left[\left(\frac{\rho}{\rho_{T, 0}}\right)^{2 / 3}-1\right]\right\} \\
K_{T, 0}^{0}=K_{0}+a_{P}\left(T-T_{0}\right) \\
K_{T, 0}^{\prime}=K_{0}^{\prime} \\
\rho_{T, 0}=\rho_{0} \exp \left(\int_{300}^{T} \alpha_{T, 0} d T\right) \\
\alpha_{T, 0}=a_{T}+b_{T} . T-c_{T} . T^{-2}
\end{array} \quad\right. \text { Used for the upper mantle }
$$

8 parameters known at ambient pressure:

- $T_{0}$ : the reference temperature
$\square \rho_{0}$ : density
- $K_{0}$ : bulk modulus
- $K_{T, O}^{\prime} \alpha_{P}$ : pressure and temperature derivatives of bulk modulus
- $a_{T}, b_{T}, c_{T}$ : thermal expansion coefficients

## The Mie-Grüneisen-Debye formulation

$$
\left\{\begin{array}{l}
P(\rho, T)=P\left(\rho, T_{0}\right)+\Delta P_{t h} \\
P\left(\rho, T_{0}\right)=\frac{3}{2} K_{0}\left[\left(\frac{\rho}{\rho_{0}}\right)^{7 / 3}-\left(\frac{\rho}{\rho_{0}}\right)^{5 / 3}\right]\left\{1-\frac{3}{4}\left(4-K_{0}^{\prime}\right)\left[\left(\frac{\rho}{\rho_{0}}\right)^{2 / 3}-1\right]\right\} \\
\Delta P_{t h}=\left(\frac{\gamma}{V}\right)\left[E\left(T, \theta_{D}\right)-E\left(T_{0}, \theta_{D}\right)\right] \\
E=9 n R T\left(\frac{T}{\theta_{D}}\right)^{3} \int_{0}^{\theta_{D} / T} t^{3} d t /\left(e^{t}-1\right) \\
\theta_{D}=\theta_{D 0}\left(\frac{\rho}{\rho_{0}}\right)^{\gamma} \\
\gamma=\gamma_{0}\left(\frac{\rho}{\rho_{0}}\right)^{-q}
\end{array} \quad \text { Used for } 1\right.
$$

Used for the lower mantle and core

Thermal and static pressure are dissociated. 8 parameters :

- $T_{0}$ : the reference temperature
- $\rho_{0}$ : density
- $K_{0}$ and $K_{T, 0}^{\prime}$ : bulk modulus and its pressure derivative
- $\theta_{\mathrm{D} 0}$ : reference Debye temperature
- n : number of atoms per chemical formula
- q and $\gamma_{0}$ : scaling exponents

| $1-10$ | 1.00 | 0.274 | 1.262 | 0.275 |  |

A planet with $50 \%$ water is $26 \%$ larger than : planet without water (for the same total mass The points Uranus and Neptune have 1 Earth radius of atmosphere removed.

GJ1214 has more than $50 \%$ ice in it. It fits well with Uranus Mass $/ \mathbf{M}_{\text {Earth }}$ and Neptune without their $\mathrm{H} 2 / \mathrm{He}$ atmosphere

## What do we know about extra-solar planets?

## Composition:

Data from Beirao et al. (2006) and Gilli et al. (2006)

Empty square is solar composition.
Filled square is the enstatite end-member composition for the Earth's mantle.
Empty circle is barycenter of all the stellar compositions. The large cross is typical uncertainties

Lines are values of $\mathrm{Mg} \#$ Areas give mass fraction of the core

## Radius versus composition ( $1 \mathrm{M}_{\mathrm{E}}<\mathrm{M}<\mathbf{1 0} \mathrm{M}_{\mathrm{E}}$ )

Total radius does not vary significantly with on the composition The amount of Fe plays a significant role for the radius of the core

## Application to water-rich planets

- How much water to add
- Equation of state of water/ice
- Radius versus mass for water-rich
planets

## How much water to add?

## Conclusions

- Plate tectonics on terrestrial planets
- What has been found so far?
- Outstanding questions

## Plate tectonics on large Earths

Plate tectonics provides a recycle of volatiles on geological timescales that may be important for the development of life
Two papers came out at the same time with two different conclusions
Valencia et al., ApJ, 2007
O'Neill and Lenardic, GRL, 2007
Valencia et al. : .... We demonstrate that as planetary mass increases, the shear stress available to overcome resistance to plate motion increases while the plate thickness decreases, thereby enhancing plate weakness.
These effects contribute favorably to the subduction of the lithosphere, an essential component of plate tectonics.
Moreover, uncertainties in achieving plate tectonics in the one earth-mass regime disappear as mass increases: super-Earths, even if dry, will exhibit plate tectonic behavior.
O'Neil and Lenardic : ... mantle convection simulations have been carried out to show that simply increasing planetary radius acts to decrease the ratio of driving to resisting stresses, and thus super-sized Earths are likely to be in an episodic or stagnant lid regime.

## Calculation of lithosphere thickness and stress

The deviatoric horizontal normal stress $(\sigma)$ responsible for causing failure on the plate is (to first order) balanced by the shear stress ( $\tau$ ) applied over the base of the plate.

The thickness of the lithosphere or boundary layer ( $\delta$ ) depends on the Rayleigh number ( Ra ) - a parameter governing convection.

$$
\frac{\delta}{D}=\left(\frac{R a}{R a_{c}}\right)^{S} \quad \text { With } \mathrm{S}=-1 / 4
$$

$R a=\frac{\alpha \rho g D^{4} q}{k \kappa \eta} \quad \tau \approx \eta \frac{u}{D} \quad u \approx \frac{\kappa}{D}(R a)^{0.5} \quad L \approx u \frac{\delta^{2}}{\kappa}$
$\tau$ is the deviatoric stress
$\eta$ is viscosity (Pa.s)
U is velocity
D is thickness of the convective layer

Given that Earth's convective state leads
$\delta \approx M^{-0.45}$ and $\quad \sigma \approx M^{1.0}$ to plate tectonics, the more favorable conditions experienced by super-Earths will inevitably lead to plate tectonics.

Scaling Factor $=1.10$; Stagnant

# "Geological consequences of 

 super-sized Earths" by C. O'Neill and A. Lenardicmantle convection simulations have been carried out to show that simply increasing planetary radius acts to decrease the ratio of driving to resisting stresses, and thus supersized Earths are likely to be in an episodic or stagnant lid regime.

$\sigma$
"Geological consequences of super-sized Earths" by C. O'Neill and A. Lenardic

$$
\begin{aligned}
\sigma & \approx \tau \frac{L}{\delta} \\
\tau & \approx \eta \frac{u}{D} \\
\tau & \approx M^{0.27} \\
u & \approx M^{1.19}
\end{aligned}
$$

Why is there no plate tectonics on Mars and Venus? Water?

## Low mass exoplanets

Table 1-1. List of transiting exoplanets with mass lower than 10 Earth masses (as of 02/02/2011, Schneider, 2011). Values for solar system planets with mass larger than Earth are given for comparison.

## CoRoT Exo-7b

Leger et al., 2009, 2011

## Conclusions

- Models give very good prediction of radii

- Amount of water is a first order parameter
- Radius is 26 \% larger for an Ocean planet with 50 \% wt of ices
- Temperature is a second order parameters.
- Composition and $\mathrm{Mg} \#$ control the size of the core.
- If Mass and Radius are perfectly known, the amount of water can be known at $\pm 4.4$ \%
- If $10 \%$ uncertainty of mass and radius, then the amount of water can be known at $\pm 20$ \%
- Number of terrestrial planets is increasing
- YES, super-Earths and mini-Neptunes can be distinguished
- BUT [Super-Earths with H2/He atm] give same values than mini-Neptunes
